

Uralla Landfill

Location: Rowan Avenue, Uralla NSW 2358 Environment Protection Licence Number: 5899 Activities: Waste disposal to land and waste processing

The internet link to Licence No. 5899 is <https://apps.epa.nsw.gov.au/prpoeapp/ViewPOEOLicence.aspx?DOCID=112613&SYSUID=1&LICID=5899>

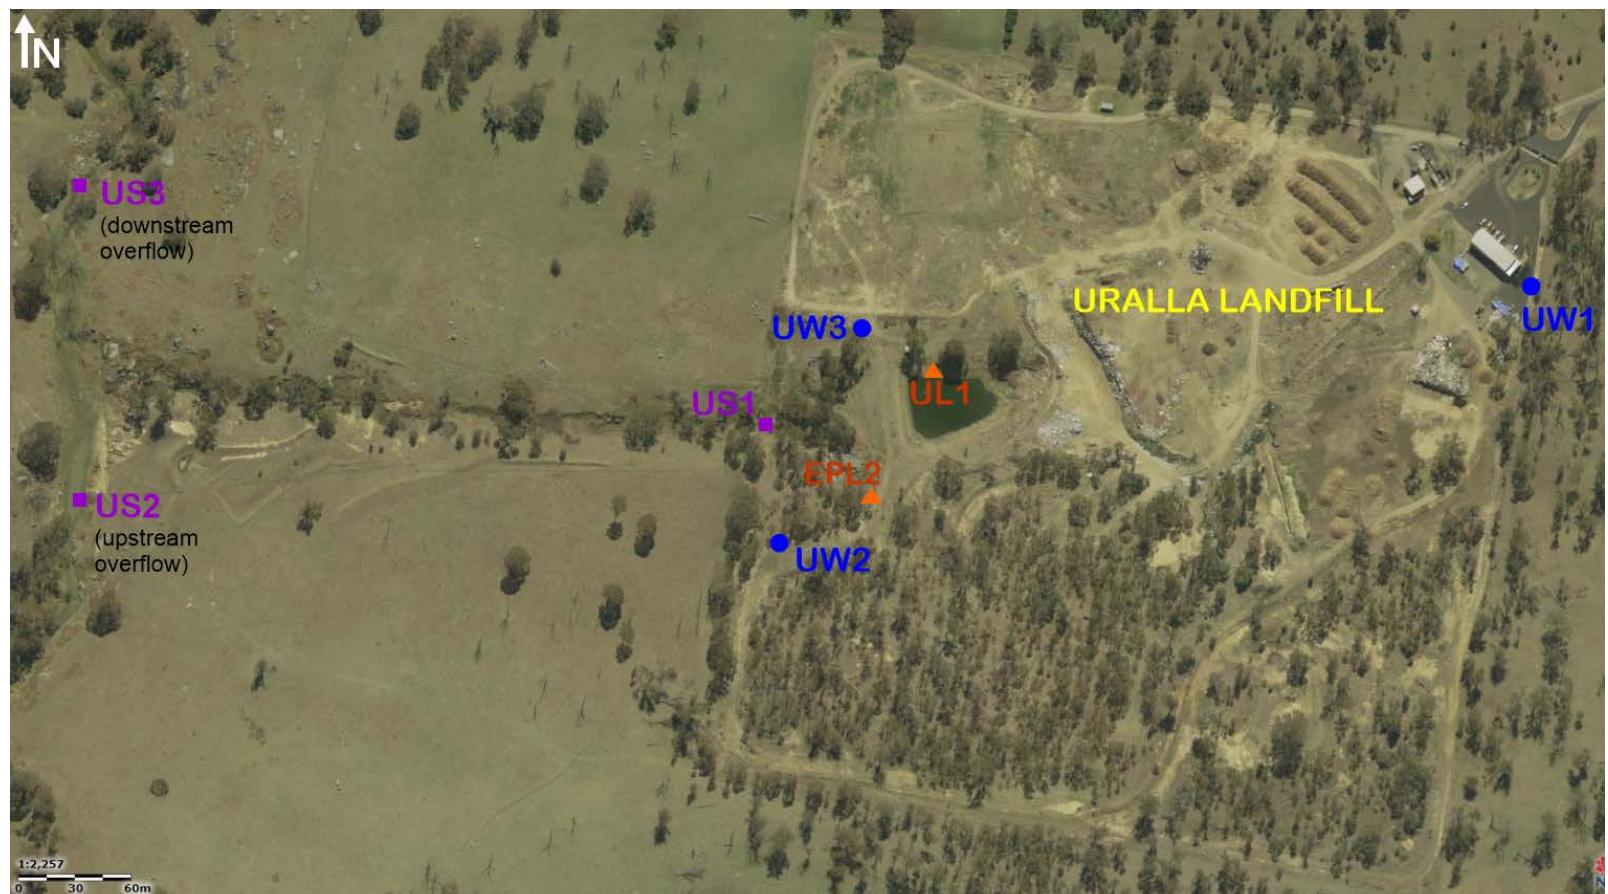

Licensee under Protection of Environment Operations Act 1997 (POEO Act):

Uralla Shire Council, PO Box 106, Uralla NSW 2358

Council is required to monitor methane, groundwater, surface water and leachate at various sampling points. This document details recent results. To meet its obligation under Section 66 (6) of the POEO Act, a link to the current version of this document is available on Council's website.

On the following figure, sampling locations are given historical names and colour coded according to the type of monitoring: U = Uralla; S = Surface water; W = Well; L = Leachate. Corresponding Environment Protection Authority (EPA) Identification Numbers detailed on the Licence are provided below.

- EPA No. 1
 - US1 (surface water)
- EPA No. 2
 - EPL2 (leachate overflow)
- EPA No. 3
 - Leachate volume discharge to irrigation area
- EPA No. 4
 - UW1 (groundwater monitoring well)
- EPA No. 5
 - UW2 (groundwater monitoring well)
- EPA No. 6
 - UW3 (groundwater monitoring well)
- EPA No. 7
 - UL1 (leachate quality)
- EPA No. 8
 - Surface methane
- EPA No. 9
 - Building methane
- EPA No. 10
 - US2 (surface water) Upstream leachate overflow sampling point
- EPA No. 11
 - US3 (surface water) Downstream leachate overflow sampling point

Base map: SIXNSW Department of Lands 2010

Monitoring results for the last four years are presented on following pages – as required in the EPA publishing requirements.

Water quality analytes are organised in the tables on following pages according to chemical grouping to assist chemical review. [Analytes are listed on the licence in alphabetical order.] They include analytes for groundwater, surface water and landfill leachate.

Tables are organised according to field and laboratory results. Field results start with the date the sampling and field tests were undertaken. Laboratory results tables start with the date the laboratory issued the results, followed by the date by which results were placed on the Uralla Shire Council website.

Abbreviations in the tables are provided here in alphabetical order:

Alk = Alkalinity measured as mg/L CaCO₃ equivalent; BTEX = Benzene, Toluene, Ethylbenzene, Xylene; Ca = Calcium; Cl = Chloride; D = Depth to water from top of internal well PVC casing; DO = Dissolved Oxygen; EC = Electrical Conductivity also called conductivity; Eh = Redox Potential; Fe = Iron; K = Potassium; Mg = Magnesium; Mn = Manganese; Na = Sodium; ND = Nil detected; NH₃ = Ammonia as a measure of ammonium ions; NO_x = Nitrite + Nitrate; NR = not required by licence; OC&OP = Organochlorine & Organophosphorus pesticides; RL = water level converted to Reduced Level relative to mean sea level; SO₄ = Sulphate; SS = Total suspended solids; Temp = Temperature; TKN = Total Kjeldahl Nitrogen (organic nitrogen + ammonia); TN = Total Nitrogen; TOC = Total Organic Carbon; TP = Total Phosphorus; VFR = Volumetric Flow Rate; VOCs = Volatile Organic Compounds; Zn = Zinc.

Measures:

mg/L = milligram per litre (equivalent to ppm); µS/cm = micro Siemens per centimetre; mV = millivolts; °C= degrees Celsius; kL = kilolitres; ppm = parts per million.

Choice of water quality analytes:

Some analytes are tested because they give a general understanding of groundwater, surface water and leachate quality. Often the concentrations are greater in leachate than in groundwater and surface water. A simple comparison can tell us if landfill leachate may have escaped into groundwater or surface water. However, care is needed when reviewing these general results so that false conclusions are not made. The salt levels in groundwater are a case in point. EC is an indicator of salt levels. If the EC has previously been low, and then becomes at least three to four times higher, one would assume it is due to landfill leachate ingress into groundwater. The Uralla Landfill groundwater has relatively low EC (Table 1). An example of EC increase/decrease is found in the UW3 historical results. Its high was 3,433 µS/cm in Year 2001 and as its nitrogen compound contamination decreased, its EC decreased too, the lowest being 1,058 µS/cm in Year 2009. So landfill leachate intrusion may be indicated if the EC becomes higher again with corresponding increase in other contaminants such as nitrogen compounds. (It is likely that well UW3 was contaminated by nitrogen compounds emanating from old night soil trenches that are upgradient from the well.)

Other analytes give us more specific information about the possible presence of landfill leachate in groundwater and surface water. Even with these we must carefully consider if their increased concentrations are definitely due to landfill leachate and are not from some other source.

- Nitrogen compounds indicate biodegradation of the plant and animal waste in our solid waste. They may also be due to fertilizer use on nearby properties or old night soil trenches. A general rule of thumb is that total nitrogen (TKN + NO_x) should be <5 mg/L.
- Iron and manganese above 10 mg/L is an indicator that landfill leachate may be present in groundwater. However, these groundwater analytes may increase due to leaching of iron and manganese from the soil after excessive rainfall or flood water infiltration.
- Organic analytes such as BTEX compounds and VOCs are most likely to indicate landfill leachate, especially if they haven't been detected before.

So it is important to monitor on a regular basis to note any changes in water quality analyte concentrations and to judiciously review the results. Increases in groundwater and surface water analyte concentrations due to landfill leachate intrusion are often at least three to four times the previous concentrations.

Comments on water quality results: Well UW3 is the only groundwater well or surface water sampling point of note – and its nitrogen compound concentrations have decreased.

Methane is a colourless, odourless gas that is flammable and explosive. It is generated approximately three months after the deposition of putrescible solid waste and once oxygen is depleted. Testing is conducted above ground surfaces to assure than none is escaping to air, and in buildings to assure against asphyxiation and explosion.

Comments on methane monitoring results: Methane is occasionally detected on covered areas of the landfill, but is remediated with soil cover, usually by the next day.

Table 5: Methane detections (surface or building)

Frequency required by licence	Detection locations	Methane (CH ₄) by volume in air	Methane (CH ₄) by volume in air	Methane (CH ₄) as % LEL (Lower Explosive Limit)	Accessible on Council website
Measure		ppm CH ₄ in air	% CH ₄ in air	% LEL	
	3 monthly				
19/03/16	Nil detected.			21/04/16
